## PREFACE

The Technical Education, Vocational and Entrepreneurship Training Authority (TEVETA) is an institution created under the Technical Education, Vocational and Entrepreneurship Training Act Number 13 of 1998, as amended by the Technical Education, Vocational and Entrepreneurship Training (Amendment) Act Number 11 of 2005.

The Act among other things provides that TEVETA shall:

- (a) regulate and conduct national examinations and assessments relating to technical education, vocational and entrepreneurship training;
- (b) charge and collect fees in respect of examinations, assessments and other services provided by the Authority;
- (c) award certificates to persons who succeed in examinations and assessments undertaken under this Act
- (d) do all such things connected with or incidental to the functions of the Authority under this Act.

Through this mandate, the Assessment and Qualifications Division of TEVETA has developed Practical Assessment Tool Kits to enable learners achieve the competences that are congruent with the demand of the workplace tasks. These tool kits in part are also intended to ensure that similar conditions under which all students in TEVET are assessed and examined apply wherever the course is undertaken in Zambia.

The Trainers shall work with the Learners to collect evidence of competence, using the benchmarks provided by the unit standards. During the year, the Learners shall be required to undertake a series of practical assessment tasks. It is the sum of all these assessments tasks that deems a Learner to be competent (or not).

This approach to assessment is not a one-off event but one that gives learners many opportunities to demonstrate skill and allow for the capturing and recording of these demonstrations.

For the Learner to be deemed competent, they must demonstrate competency in every aspect of the practical tasks being undertaken. It must however be understood by the Trainer that Competency does not mean expert. It means that the candidate has attained sufficient skill and knowledge to perform the activity or service to a degree and quality that is acceptable to the industry and the customer in a time within which a competent person at the level could reasonably be expected to perform the task.

While this will be undertaken at institutional level, it is therefore envisaged that the Assessment principles of VALIDITY, RELIABILITY, FAIRENESS and FLEXIBILITY shall at all times be adhered to.

## Pre-Assessment

Assessment process explained to the employee (✓ if Yes).	<input type="checkbox"/>
Any appeal relating to the outcome of the assessment or the way in which the assessment was conducted shall be made through the company's <i><u>fair treatment policy</u></i> as explained to the employee (✓ if Yes).	<input type="checkbox"/>

<b>Employee/Trainee</b>  Employee/Trainee name: _____ (Print)  Employee/Trainee comments:		<b>Assessor</b>  Assessor name: _____ (Print)  Assessor comments:	
I fully understand the assessment and appeals process.		Theory assessment sighted and checked as satisfactory.

Observation Checklist

1 PERFORM AN EXPERIMENT ON PREPARATION OF A SINGLE SALT	Satisfactory			Not Satisfactory		
During observation of work activities, the candidate demonstrated that they can:						
a. Identify the apparatus correctly. This may include: <div><input type="checkbox"/> Heat source <input type="checkbox"/> Evaporating dish <input type="checkbox"/> Desiccator <input type="checkbox"/> Reagent sample <input type="checkbox"/> Beaker</div>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b. Set up the apparatus correctly. This may include: <div><input type="checkbox"/> Getting and assembling the required equipment and materials for the experiment</div>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c. Run the experiment correctly. This may include: <div><input type="checkbox"/> Putting some solution of the salt into evaporating dish <input type="checkbox"/> Putting the evaporating dish on a source of heat <input type="checkbox"/> Heating slowly and gently <input type="checkbox"/> Removing the evaporating dish from heat source when crystals start forming <input type="checkbox"/> Cooling the sample <input type="checkbox"/> Drying it in the desiccators.</div>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d. Interpret the results correctly. This may include: <div><input type="checkbox"/> Identifying the salt by appropriate means <input type="checkbox"/> Storing it in a well labeled container</div>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e. Identify the errors that may affect the experiment and how they can be avoided.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

2 PERFORMING AN EXPERIMENT ON PREPARATION OF GAS	Satisfactory	Not Satisfactory
During observation of work activities, the candidate demonstrated that they can:		
a. Identify the apparatus correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Clamp stand</li> <li><input type="checkbox"/> Flat bottomed flask</li> <li><input type="checkbox"/> Rubber bung with two holes</li> <li><input type="checkbox"/> Marble chips, (Calcium carbonate)</li> <li><input type="checkbox"/> 0.5 M hydrochloric acid</li> <li><input type="checkbox"/> Lime water</li> <li><input type="checkbox"/> Thistle funnel</li> <li><input type="checkbox"/> Glass delivery tube</li> <li><input type="checkbox"/> Gas jars</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>
b. Set up the apparatus correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Getting and assembling the required materials and apparatus</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>
c. Run the experiment correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Clamping the flat bottomed flask</li> <li><input type="checkbox"/> Putting marble chips into a flat bottomed flask</li> <li><input type="checkbox"/> Fixing a rubber bung with two holes, one to receive the thistle funnel and the other the glass delivery tube</li> <li><input type="checkbox"/> Directing the glass delivery tube into a bottomed of a gas jar</li> <li><input type="checkbox"/> Pouring the dilute hydrochloric acid into the bottomed flask thistle funnel and ensuring that the tip of the thistle funnel is dipped into the acid</li> <li><input type="checkbox"/> Collecting the gas in many gas jars by upward displacement of air</li> <li><input type="checkbox"/> Testing the gas so prepared</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>
d. Interpret the results. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Identifying the gas so produced by appropriate methods</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>
e. Identify the errors that may affect the experiment and how they can be avoided.	<input type="checkbox"/>	<input type="checkbox"/>

3 PERFORMING AN EXPERIMENT ON PURIFYING SOLUTIONS BY FRACTIONAL DISTILLATION	Satisfactory	Not Satisfactory
During observation of work activities, the candidate demonstrated that they can:		
a. Identify the apparatus correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Fractionating column</li> <li><input type="checkbox"/> Condenser</li> <li><input type="checkbox"/> Source of running water</li> <li><input type="checkbox"/> Rubber tubes</li> <li><input type="checkbox"/> Sample for separating</li> <li><input type="checkbox"/> small beakers</li> <li><input type="checkbox"/> Glass laboratory thermometer</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>
b. Set up the apparatus correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Arranging the apparatus required for fractional distillation and the materials in order</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>
c. Run the experiment correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Pouring the mixture into the round bottomed flask</li> <li><input type="checkbox"/> Putting the thermometer condensing system and collecting vessel in place</li> <li><input type="checkbox"/> Heating the round bottomed flask and collect the components in the mixture as they come out of the condenser</li> <li><input type="checkbox"/> Collecting the separate liquids</li> <li><input type="checkbox"/> Testing the liquids separated using boiling points</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>
d. Interpret results correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Identifying the liquids correctly</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>
e. Identify the errors that may affect the experiment and how they can be avoided.	<input type="checkbox"/>	<input type="checkbox"/>

4 PERFORMING AN EXPERIMENT ON GRAVITMETRIC ANALYSIS OF SOLUBLE CHLORIDE	Satisfactory		Not Satisfactory	
During observation of work activities, the candidate demonstrated that they can:				
a. Identify the apparatus correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Precipitating reagent silver nitrate solution</li> <li><input type="checkbox"/> Unknown chloride sample (free-flowing powder)</li> <li><input type="checkbox"/> Three porcelain filter crucibles</li> <li><input type="checkbox"/> Permanent marker</li> <li><input type="checkbox"/> Oven (100 – 110°C)</li> <li><input type="checkbox"/> Beaker</li> <li><input type="checkbox"/> Watch glass</li> <li><input type="checkbox"/> Desiccator</li> <li><input type="checkbox"/> Electronic balance</li> <li><input type="checkbox"/> Water</li> <li><input type="checkbox"/> dilute mineral acid/ base</li> <li><input type="checkbox"/> Concentrated ammonia</li> <li><input type="checkbox"/> Concentrated nitric acid</li> <li><input type="checkbox"/> Concentrated hydrochloric acid</li> <li><input type="checkbox"/> Vacuum flask</li> <li><input type="checkbox"/> Crucible holder</li> <li><input type="checkbox"/> Rubber hose</li> <li><input type="checkbox"/> wash bottle</li> <li><input type="checkbox"/> Glass rod</li> <li><input type="checkbox"/> Rubber policeman</li> <li><input type="checkbox"/> 0.01M nitric acid</li> <li><input type="checkbox"/> Fume hood</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

<p>ii. Set up the apparatus correctly. This may includes:</p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Clean and dry three porcelain filter crucibles. Make sure crucibles are marked so they can be distinguished from one another. Use a permanent marker.</li> <li><input type="checkbox"/> Dry crucibles in the oven at 100-110 °C for one hour or overnight. The crucibles should be put in a labeled beaker and covered with a watch glass when in the oven.</li> <li><input type="checkbox"/> Cool the crucibles in a desiccator for 20 minutes and weigh.</li> <li><input type="checkbox"/> Repeat Steps 2 and 3, this time oven-drying for only 20 minutes.</li> <li><input type="checkbox"/> Repeat this procedure until the mass of each crucible agrees to within 0.3 mg between weighings.</li> </ul> <p><b>Note: Cleaning Procedure for Porcelain Filter Crucibles</b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Scraping any large amount of gray or purplish precipitate in the crucible into the waste container for <b>Solid AgCl</b>.</li> <li><input type="checkbox"/> Thoroughly wash the inside and outside of the crucible with a test tube brush and a small amount of soapy water. <b>Soak off and remove all paper or tape labels.</b></li> <li><input type="checkbox"/> If there is a gray or white residue in the crucible, add about 100 mL of water to a filter flask to dilute the rinse acid or base when it comes through. Mounting the filter crucible in the filter flask, add 1-2 mL of concentrated NH<sub>3</sub>, let it sit for a few of minutes, then apply a gentle vacuum to pull the resulting solution through the fritted bottom. Follow by rinsing with large amounts of distilled water from a wash bottle. You may need to repeat this procedure 2 or 3 more times.</li> </ul> <p><b>NOTE:</b> Always break the vacuum first before you turn off the aspirator water.</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
---	--------------------------	--------------------------	--------------------------	--------------------------	--------------------------	--------------------------

<p><input type="checkbox"/> If a dark stain remains, empty the contents of the filter flask in the appropriate waste container and add a few mL of conc. <math>\text{HNO}_3</math> to the crucible. Let it sit for a few minutes, apply a gentle vacuum as before, and rinse the crucible thoroughly with distilled water.</p> <p><input type="checkbox"/> If there is a reddish stain in the crucible, empty it and add a few drops of conc. <math>\text{HCl}</math>. This should remove it nicely. Proceed as with <math>\text{HNO}_3</math> above. If the crucible does not filter rapidly (1-2 drops per second) after this cleaning, repeat the entire procedure. If it still does not drain rapidly under vacuum, consult with your lecturer.</p> <p><input type="checkbox"/> After you are completely done. Rinse the vacuum flask and crucible holder thoroughly with distilled water. Turn on the vacuum and squirt some distilled water down the rubber hose. Place the vacuum flask, crucible holder, and rubber hose back in their proper drawers.</p> <p><b>Hazardous Waste Note:</b> The <math>\text{NH}_3</math> waste (basic) container is housed in a separate hood from the <math>\text{HNO}_3</math> and the <math>\text{HCl}</math> waste (acidic) containers.</p> <p><b>Preparation of the Chloride Unknown Samples</b></p> <p><input type="checkbox"/> Drying the sample in an oven at <math>110^\circ\text{C}</math> for 1-2 hours or overnight.</p> <p><input type="checkbox"/> Weighing out <b>accurately</b>, by difference, three portions of the dried sample of about 0.5 to 0.7 g each to within <math>\pm 0.1</math> mg.</p> <p><b>NOTE: NEVER transfer chemicals inside the balance.</b></p> <p><input type="checkbox"/> Dissolving each portion in a clean, separate, labeled 400-mL beaker, using 150 mL of distilled water to which about 1 mL of concentrated nitric acid has been added.</p> <p><input type="checkbox"/> Placing a watch glass cover on each beaker.</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
---	--------------------------	--------------------------	--------------------------	--------------------------	--------------------------	--------------------------

c. Run the experiment correctly. This may include:

### Precipitation of Chloride with Silver Ion

- ☐ Heating the chloride solutions to gentle simmering on a hotplate and keep each one hot until the AgCl is fully precipitated. **Precipitate the chloride from one unknown solution at a time.**
- ☐ 2. Going to the hood containing the stock silver nitrate solution and carefully **pour about 80mL of the solution into a 100-mL graduated cylinder.** [Each unknown will require about 50-70 mL to precipitate the Cl<sup>-</sup> completely.
- ☐ **DO NOT FILL ANY CONTAINER LARGER THAN 100 mL with the stock silver nitrate solution. Owing to severewastage of very expensive silver nitrate in the past, any student caught filling alarger container with the stock solution will be penalized severely.**
- ☐ Stirring constantly **with a glass stirring rod** (do NOT use a magnetic stirrer and stir bar), add the silver nitrate from the graduated cylinder in approximately 5 mL increments to your first unknown solution until the precipitation of the silver chloride is complete. To check for complete precipitation, silver nitrate must be added in small quantities and vigorously stirred. Allow the precipitate to settle a bit and add some more silver nitrate solution (no stirring yet). If the solution becomes cloudy, keep adding. If the solution remains clear, then add a total of about 5% more silver nitrate solution than you have added to that point.
- ☐ Placing the beaker (covered) in the laboratory cabinet for at least one hour to “digest” before filtering. This minimizes exposure of the AgCl to light and consequent decomposition.
- ☐ Repeating this precipitation and digestion for your other unknown solutions, one at a time. If you have used a graduated cylinder to monitor the volume of silver nitrate solution used for your first unknown solution, then you can then estimate about how much you need to add to the remaining samples. Simply ratio the volume to be used based on the masses of the two unknown samples that you weighed out.

☐ ☐ ☐ ☐ ☐ ☐

<p><b>Filtration and Final Weighing</b></p> <p>This procedure should be done separately for each sample in turn.</p> <ul style="list-style-type: none"> <li><input type="checkbox"/> After the solution has digested for a <i>minimum of 1 hour</i>, filter the supernatant liquid through a labeled, weighed filter crucible with suction, keeping most of the precipitate in the beaker. <i>NOTE: Always break the suction on the flask before turning off the waterflow on the aspirator.</i></li> <li><input type="checkbox"/> Testing the filtrate in the suction flask for complete precipitation by again adding a few drops of silver nitrate solution. If your filtrate remains clear, dispose of the filtrate in the appropriate waste container.</li> <li><input type="checkbox"/> Wash the precipitate with three 25-mL portions of 0.01 M nitric acid (2 drops of concentrated HNO<sub>3</sub> per 100 mL of water) using your washing bottle. [A standard-sized washing bottle will hold about 500 mL.] The washings are poured through the filter crucible and the precipitate is left in the beaker. If any of the precipitate has dried on the sides of the beaker or the glass stirring rod, scrape them down with a rubber policeman and rinse with small amounts of the wash solution during this process to ensure that 100% of the precipitate will be filtered off into the filter crucible.</li> <li><input type="checkbox"/> Stirring the bulk of the precipitate up in a small volume of 0.01 M HNO<sub>3</sub> and quantitatively transfer the precipitate to the crucible.</li> <li><input type="checkbox"/> After filtering, placing the crucibles in a large beaker covered with a watch glass and dry at 120-140 °C for 2 hours. You can leave the crucibles overnight, if you return the next day and put them in your desiccator.</li> <li><input type="checkbox"/> Cooling in a desiccator and weigh.</li> <li><input type="checkbox"/> Return them to the oven for 20 minutes. Then cooling in the desiccator for 20 minutes and reweigh. Repeating this step until the mass of a crucible with the precipitate agrees to within 0.4 mg.</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<p>d. Interpret the results correctly. This may include:</p> <ul style="list-style-type: none"> <li><input type="checkbox"/> working out the gravimetric factor from <math>\frac{m_{Cl}}{m_{AgCl}} = \frac{35.453 \text{ g mol}^{-1} Cl}{143.321 \text{ g mol}^{-1} AgCl} = 0.247368 \text{ Cl/AgCl}</math> where m is the mass in grams</li> <li><input type="checkbox"/> The mass of chlorine in the sample is <math>m_{Cl} = m_{AgCl} \times \text{gravimetric factor}</math></li> <li><input type="checkbox"/> Percentage of Cl = <math>\left( \frac{m_{Cl}}{m_{AgCl}} \right) \times 100\%</math></li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<p>e. Identify the errors that may affect the experiment and how they can be avoided.</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

5 PERFORMING AN EXPERIMENT TO DETERMINE THE MELTING POINT OF A SUBSTANCE CORRECTLY				Satisfactory		Not Satisfactory			
During observation of work activities, the candidate demonstrated that they can:									
a. Identify the apparatus correctly. This may include:  <div><input type="checkbox"/> Finely ground sample <input type="checkbox"/> Capillary tube <input type="checkbox"/> Heating block <input type="checkbox"/> Platinum resistance thermometer <input type="checkbox"/> OptiMelt</div>				<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b. Set up the apparatus correctly. This may include:  <div><input type="checkbox"/> Arrange the materials and apparatus for use</div>				<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

<p>c. Run the experiment correctly. This may include:</p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Putting the finely ground dry powder of the sample into the thin glass capillary tube closed at one end to 2 to 3 mm</li> <li><input type="checkbox"/> Tightly packing the sample to improve the measurement</li> <li><input type="checkbox"/> Maintaining a fixed level in the fill is also a very important requirement.</li> <li><input type="checkbox"/> Wiping the outside surface of capillary tubes with a clean cloth before inserting them into the heating stand.</li> <li><input type="checkbox"/> Dusting the glass window of the heating block reducing overall visibility of the melt</li> <li><input type="checkbox"/> Making sure OptiMelt is plugged in and set to a start temperature below the expected MP of the sample(s) before placing any capillaries into the sample slots.</li> <li><input type="checkbox"/> A thin glass capillary tube containing a compact column of the substance to be determined is introduced into a heated stand (liquid bath or metal block) in close proximity to a high accuracy thermometer.</li> <li><input type="checkbox"/> The temperature in the heating block is ramped at a user-programmable fixed rate until the sample in the tube transitions into the liquid state.</li> <li><input type="checkbox"/> Inserting a platinum resistance thermometer into one of the slots on the stand</li> <li><input type="checkbox"/> Switching on the heating block</li> <li><input type="checkbox"/> Observing at the glass window until the sample melts completely</li> <li><input type="checkbox"/> Switch off the instrument when melting takes place and note down the temperature</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<p>d. Interpreting the results correctly. This may include:</p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Noting down the melting point</li> <li><input type="checkbox"/> Comparing the melting to the standard values of melting points and hence determine the substance under investigation</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<p>v. Identify the errors that may affect the experiment and how they can be avoided.</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

6 PERFORM AN EXPERIMENT ON USE OF SPECTROPHOTOMETER IN THE PREPARATION OF A STANDARD CURVE AND FINDING THE CONCENTRATION OF UNKNOWN	Satisfactory	Not Satisfactory
During observation of work activities, the candidate demonstrated that they can:		
a. Identify the apparatus correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Spectrophotometer</li> <li><input type="checkbox"/> Standard solution, 20mmol/L protein</li> <li><input type="checkbox"/> Test tubes (7)</li> <li><input type="checkbox"/> Test tube rack (1)</li> <li><input type="checkbox"/> Distilled water</li> <li><input type="checkbox"/> Cuvette</li> <li><input type="checkbox"/> Biuret reagent</li> <li><input type="checkbox"/> 10 ml graduated glass pipettes (2)</li> <li><input type="checkbox"/> Pasteur pipette</li> <li><input type="checkbox"/> Safety goggles</li> <li><input type="checkbox"/> Latex gloves</li> <li><input type="checkbox"/> Unknown Xmmol/L</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>
b. Set up the apparatus correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Labelling the test tubes, Blank, unknown X, 4mmol/L, 8mmol/L, 12mmol/L, 16mmol/L, 20mmol/L,</li> <li><input type="checkbox"/> Putting the test tubes in the test tube rack</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>

<p>c. Run the experiment correctly. This may include:</p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Using the dilution equation <math>M_1V_1 = M_2V_2</math> prepare serially diluted solutions with following concentrations: 0 mmol/L, 4mmol/L, 8mmol/L, 12mmol/L, 16mmol/L, and 20mmol/L</li> <li>➤ Pipetting 10 ml of distilled water into the test tube labelled Blank and putting it back into the test tube rack.</li> <li>➤ Pipetting 2 ml of 20mmol/L into a test labelled 4mmol/L and then pipetting 8 ml of distilled into the same test tube. Mixing thoroughly and putting it back into the test tube rack.</li> <li>➤ Pipetting 4ml of 20mmol/L into a test labelled 8 mmol/L and then pipetting 6 ml of distilled into the same test tube. Mixing thoroughly and putting it back into the test tube rack.</li> <li>➤ Pipetting 6 ml of 20 mmol/L into a test labelled 12mmol/L and then pipetting 4 ml of distilled into the same test tube. Mixing thoroughly and putting it back into the test tube rack.</li> <li>➤ Pipetting 8 ml of 20 mmol/L into a test labelled 16mmol/L and then pipetting 2 ml of distilled into the same test tube. Mixing thoroughly and putting it back into the test tube rack.</li> <li>➤ Pipetting 10 ml of 20 mmol/L into a test labelled 20mmol/L and then pipetting 0 ml of distilled into the same test tube. Mixing thoroughly and putting it back into the test tube rack.</li> <li>➤ Do not add water to the unknown X</li> <li>➤ Adding 2-3 drops of biuret reagent to all the test tubes</li> <li><input type="checkbox"/> Incubating at room temperature for 10 minutes.</li> <li><input type="checkbox"/> Noting down the colours development</li> <li><input type="checkbox"/> Switching on the spectrophotometer and calibrate it at 540nm</li> <li><input type="checkbox"/> Measuring the absorbancies of the solutions and record them in a table</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<p>d. Interpret the results correctly. This may include:</p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Plotting the graph of absorbance versus concentration</li> <li><input type="checkbox"/> Finding the concentration of the unknown by Beer's law or by interpolation</li> </ul>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

e. Identify the errors that may affect the experiment and how they can be avoided.

9 PERFORM AN EXPERIMENT TO IDENTIFY DIFFERENT TYPES OF ANIONS	Satisfactory			Not Satisfactory		
During observation of work activities, the candidate demonstrated that they can:						
<div>a. Identify the apparatus needed correctly. This may include:</div> <div><div><input type="checkbox"/> Sample solutions of the following anions</div><div><div>➤ OH<sup>-</sup></div><div>➤ Cl<sup>-</sup></div><div>➤ Br<sup>-</sup></div><div>➤ I<sup>-</sup></div><div>➤ SO<sub>4</sub><sup>2-</sup></div><div>➤ S<sup>2-</sup></div><div>➤ CO<sub>3</sub><sup>2-</sup></div><div>➤ CrO<sub>4</sub><sup>2-</sup></div><div>➤ NO<sub>3</sub><sup>-</sup></div><div>➤ SO<sub>3</sub><sup>2-</sup></div></div><div><div><input type="checkbox"/> Testing reagents include:</div><div><div>➤ Barium nitrate solution</div><div>➤ barium chloride solution</div><div>➤ Silver nitrate solution</div><div>➤ Lead ethanoate solution</div><div>➤ Nitric acid solution</div><div>➤ Potassium dichromate (VI) paper</div><div>➤ Lead ethanoate</div><div>➤ Concentrated sulphuric acid</div><div>➤ Aluminium foil (Devardas ‘ Alloy)</div><div>➤ Litmus paper or universal indicator</div><div>➤ Lime water</div></div></div><div><div><input type="checkbox"/> Test tubes</div><div><input type="checkbox"/> Test tube racks</div><div><input type="checkbox"/> Heat source</div><div><input type="checkbox"/> Pasteur pipette</div><div><input type="checkbox"/> Stickers</div><div><input type="checkbox"/> dilute hydrochloric acid</div><div><input type="checkbox"/> Marker for labeling</div><div><input type="checkbox"/> 2ml Pasteur pipette</div><div><input type="checkbox"/> Latex gloves</div><div><input type="checkbox"/> Safety goggles</div></div></div>						

b. Set up the apparatus correctly. This may include: <ul style="list-style-type: none"> <li><input type="checkbox"/> Wearing latex gloves</li> <li><input type="checkbox"/> Wearing safety goggles</li> <li><input type="checkbox"/> Labeling test tubes according to the number of anions</li> <li><input type="checkbox"/> Pipette equal amount of sample solution in each test tube</li> </ul> <b>Note: The reagent should be added at a time to all the test tubes</b>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
--	--------------------------	--------------------------	--------------------------	--------------------------	--------------------------	--------------------------

<p>c. Run the experiment correctly. This may include:</p> <p><b>Carbonate ion test <math>\text{CO}_3^{2-}</math></b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Adding dilute strong acid of the suspected solid of carbonate.             <ul style="list-style-type: none"> <li>➤ If gas is given off, test with lime water. White precipitate forms if carbon dioxide is produced.</li> </ul> </li> <li><input type="checkbox"/> Heating the solid strongly and testing the gas given off with lime water.             <ul style="list-style-type: none"> <li>➤ If white precipitate form then carbon dioxide is present</li> </ul> </li> </ul> <p><b>Sulphate(VI) ion test <math>\text{SO}_4^{2-}</math></b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> To a solution of suspected sulphate add dilute hydrochloric acid and a few drops of barium chloride or nitrate solution             <ul style="list-style-type: none"> <li>➤ A white precipitate of barium sulphate is the test for sulphate ion</li> </ul> </li> </ul> <p><b>Sulphite(IV) ion test <math>\text{SO}_3^{2-}</math></b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Add dilute hydrochloric acid to the suspected sulphite             <ul style="list-style-type: none"> <li>➤ A choking sulphur dioxide gas is formed is a test for sulphite</li> </ul> </li> <li><input type="checkbox"/> Test any gas evolved with fresh potassium dichromate (VI) paper             <ul style="list-style-type: none"> <li>➤ The dichromate paper turns from orange to green confirmatory test for sulphite</li> </ul> </li> <li><input type="checkbox"/> Adding barium chloride or barium nitrate solution             <ul style="list-style-type: none"> <li>➤ A white precipitate of barium sulphite which dissolves in excess hydrochloric acid to give off a clear colourless solution</li> </ul> </li> </ul> <p><b>Sulphide ion test <math>\text{S}^{2-}</math></b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> If soluble sulphide, add a few drops of lead (II) ethanoate solution(VI)             <ul style="list-style-type: none"> <li>➤ Black precipitate of lead sulphide is formed</li> </ul> </li> <li><input type="checkbox"/> If sulphide is solid, add dilute hydrochloric acid and test smelly gas with damp lead ethanoate paper</li> </ul> <p>Rotten egg smell of hydrogen sulphide and the gas turns lead (II) ethanoate paper black</p> <p><b>Chloride ion test <math>\text{Cl}^-</math></b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> If a soluble chloride, add dilute nitric acid and silver nitrate solution .The silver nitrate is acidified with dilute nitric acid to prevent the precipitation of other non-halide silver salts             <ul style="list-style-type: none"> <li>➤ A white precipitate of silver chloride soluble in dilute ammonia is formed</li> </ul> </li> <li><input type="checkbox"/> If insoluble salt, add concentrated</li> </ul>						
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**Bromide ion test  $\text{Br}^-$** 

- ☐ If bromide is soluble, add dilute nitric acid and silver nitrate. The silver nitrate is acidified with dilute nitric acid to prevent the precipitation of other non-halide silver salts,
  - Cream precipitate of silver bromide forms only soluble in concentrated ammonia
- ☐ If insoluble salt, add concentrated sulphuric acid, warm gently if necessary
  - Orange vapour of bromine and pungent fumes sulphur dioxide form
- ☐ Adding lead (II) nitrate solution
  - A white precipitate of lead (II) bromide is formed

**Iodide ion test  $\text{I}^-$** 

- ☐ If iodide is soluble, add dilute nitric acid and silver nitrate solution. The silver nitrate is acidified with dilute nitric acid to prevent the precipitation of other non-halide silver salts
  - Yellow precipitate of silver iodide insoluble in concentrated ammonia
- ☐ If insoluble salt, can heat with concentrated sulphuric acid
  - Yellow precipitate of lead (II) iodide

**Nitrate (V) ion test  $\text{NO}_3^-$** 

- ☐ Boil the suspected nitrate with sodium hydroxide solution and fine aluminium powder (Devarda's Alloy) or aluminium foil
  - The fumes contain ammonia, which turns red litmus blue
- ☐ Add iron(II) sulphate solution and then conc. sulphuric acid (the '**brown ring**' test)
  - Where the liquids meet a brown ring forms
- ☐ Strongly heating nitrates of  $\text{M}^{2+}$  salts  
Nasty brown gas (beware!) of nitrogen(IV) oxide (nitrogen dioxide)

**Hydroxide ion test  $\text{OH}^-$** 

- ☐ Litmus or universal indicator or pH meter
  - It turns litmus blue, variety of colours universal indicator dark green – violet for weak – strong.
- ☐ Add a little of ammonium salt
  - If strongly alkaline ammonia should be released

**Chromate(VI) ion test  $\text{CrO}_4^{2-}$** 

- ☐ Add dilute sulphuric acid.
  - The yellow solution turns orange as the dichromate(VI) ion

d. Interpret the results correctly. This may include: <input type="checkbox"/> Noting down the colours produced <input type="checkbox"/> Identifying the anions <b>Note: care should be take when handling chemicals</b>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e. Identify the errors that may affect the experiment and how they can be avoided.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
